

Election Configuration

Efficiently manage crucial election processes

Election Configuration is the core of our Election Management Platform.

The software's intuitive interface and embedded instructions help guide the user through all the steps in their processes, minimizing human error and increasing accuracy and efficiency.

Intuitive

Efficiente

Auditable

How does it work

From voter registration to results publishing, with Election Configuration users can easily execute all the administrative tasks related to the chosen configuration.

Use Election Configuration to:

- Define and configure election events, such as mock elections, early voting, and official elections.
- Efficiently manage election data, such as contests, candidates, and polling places.
- Easily configure ballots.
- Manage election preparation milestones.
- Generate the configuration of the election devices, such as voting machines, optical scanners, voter verification devices, e-poll books, and poll worker support devices.

The system furthermore provides relevant post-election information regarding its performance, which is often needed for audit reports and legal documents.

Users benefit from a highly usable system that supports efficiency.

- Election process milestones are represented as stages. Within each stage, a set of predefined tasks are to be executed.
- The system reminds the user which tasks are to be performed and when, and continuously provides the user with the status of each pre-configured task. The system checks that all the information needed for a specific task is complete. To ensure complete accuracy, stages are activated only after the previous stage is completed.
- Crucial information generated for and during the election, such as polling station locations or election subdivisions, can be saved for use in future events. Reusing information simplifies the configuration of other elections and save precious time.

Efficiently execute the crucial tasks of your election.
